

**TITRATION ANALYSIS
FOR
GOLD KING MINE
SILVERTON, SAN JUAN COUNTY, COLORADO**

Prepared for
UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 8

Prepared by
WESTON SOLUTIONS, INC.
Region 8 Superfund Technical Assessment and Response Team

Date: August 20, 2015

Project Dates of Sampling:	August, 2015
Contract Name:	START IV
Contract No.:	EP-S8-13-01
Technical Direction Document No.:	0001/1508-04

Purpose: To determine the concentration of sodium hydroxide or calcium hydroxide necessary to treat a volume of mine waste water from the Gold King Mine.

Method

The mine waste leachate was cooled to a temperature of 40-45°F (4.4-7.2°C) by placing 1-liter aliquots of the leachate in a refrigerator and freezer.

A titration setup was created using the following equipment:

- Burette connected to ring stand with a burette clamp
- 500 mL beaker for leachate
- Stir plate with magnetic stir bar
- YSI connected to ring stand with a clamp for pH measurements

Sodium hydroxide solutions were made by diluting 50% (w/w) NaOH to concentrations of 3%, 9%, 12% and 15% (Appendix A). Calcium hydroxide solutions were made by diluting solid $\text{Ca}(\text{OH})_2$ to concentrations of 3% and 6% (Appendix A). Titrations were run in order of increasing concentration beginning with NaOH titrations then moving to $\text{Ca}(\text{OH})_2$ titrations. Each titration was considered complete at a pH of 7-7.5.

Results

Photographs of the titration process are available in Appendix B. Graphs of titrant volume vs. pH are available in Appendix C.

3% Sodium Hydroxide

Volume of Titrant (mL)	pH
0	2.94
1.0	3.45
2.0	4.01
3.0	4.85
4.0	5.61
5.0	6.19
5.5	6.91
6.0	7.63

Observations

Temperature of the leachate prior to adding titrant: 4.6°C

Temperature of the leachate at pH endpoint: 8.4°C

No change in color was initially observed. After continued reaction and settling, an orange precipitate formed and settled on the bottom of the beaker. The type of precipitate (floc) was fluffy.

9% Sodium Hydroxide

Volume of Titrant (mL)	pH
0	2.94
0.5	3.29
1.0	4.17
1.5	5.25
1.7	5.79
1.9	6.54
2.0	7.11

Observations

Temperature of the leachate prior to adding titrant: 5.3°C

Temperature of the leachate at pH endpoint: 8.3°C

An orange precipitate formed immediately at the endpoint and settled on the bottom of the beaker. The type of precipitate (floc) was fluffy. Water above the precipitate was clear.

12% Sodium Hydroxide

Volume of Titrant (mL)	pH
0	2.97
0.2	3.24
0.5	3.41
0.7	3.96
1.0	4.73
1.1	5.23
1.2	5.62
1.3	5.94
1.4	6.37
1.5	7.15

Observations

Temperature of the leachate prior to adding titrant: 8.8°C

Temperature of the leachate at pH endpoint: 10.6°C

The pH did not immediately respond to titrant aliquots. Instead, the pH was observed to continuously increase slowly with each aliquot added. This could be a result of the slow stir rate used to simulate river mixing. An orange precipitate formed immediately at the endpoint and settled on the bottom of the beaker. The type of precipitate (floc) was fluffy. Water above the precipitate was clear.

15% Sodium Hydroxide

Volume of Titrant (mL)	pH
0	2.90
0.1	3.32
0.2	3.76
0.3	4.33
0.4	4.74
0.5	5.05
0.7	5.74
0.9	6.52
1.0	7.97

Observations

Temperature of the leachate prior to adding titrant: 5.4°C

Temperature of the leachate at pH endpoint: 8.8°C

The pH did not immediately respond to titrant aliquots. Instead, the pH was observed to continuously increase slowly with each aliquot added. This could be a result of the slow stir rate used to simulate river mixing. An orange precipitate formed immediately at the endpoint and settled on the bottom of the beaker. The type of precipitate (floc) was fluffy. Water above the precipitate was clear.

3% Calcium Hydroxide

Volume of Titrant (mL)	pH
0	2.93
1.0	4.92
1.5	6.28
1.6	7.87

Observations

Temperature of the leachate prior to adding titrant: 5.2°C

Temperature of the leachate at pH endpoint: 14.5°C

3% $\text{Ca}(\text{OH})_2$ was not completely soluble and a gradient of $\text{Ca}(\text{OH})_2$ was observed in the burette. Therefore, the results of the titration may not be indicative of the target titrant concentration. An orange precipitate formed immediately at the endpoint and settled on the bottom of the beaker. The type of precipitate (floc) was pin. Water above the precipitate was clear.

6% Calcium Hydroxide

Volume of Titrant (mL)	pH
0	2.91
0.1	3.21
0.2	3.53
0.4	3.82
0.5	4.50
0.6	4.79
0.7	5.1
0.8	5.5
0.9	5.82
1.0	6.13
1.1	Initial: 6.67 After 5 minutes: 7.64

Observations

Temperature of the leachate prior to adding titrant: 5.2°C

Temperature of the leachate at pH endpoint: 14.5°C

6% $\text{Ca}(\text{OH})_2$ was not completely soluble and a gradient of $\text{Ca}(\text{OH})_2$ was observed in the burette. Therefore, the results of the titration may not be indicative of the target titrant concentration. An orange precipitate formed immediately at the endpoint and settled on the bottom of the beaker. The type of precipitate (floc) was pin. Water above the precipitate was clear.

Sodium Hydroxide Calculations

50% NaOH

$$M_1 V_1 = M_2 V_2$$

$$3\% \quad (50\%)(V_1) = (3\%)(100 \text{ mL})$$

FINAL VOL.

$$V_1 = 6 \text{ mL}$$

$$6\% \quad V_1 = 12 \text{ mL}$$

$$9\% \quad V_1 = 18 \text{ mL}$$

$$12\% \quad V_1 = 24 \text{ mL}$$

$$15\% \quad V_1 = 30 \text{ mL}$$

$$18\% \quad V_1 = 36 \text{ mL}$$

$$21\% \quad V_1 = 42 \text{ mL}$$

$$24\% \quad V_1 = 48 \text{ mL}$$

Calcium Hydroxide Calculations

$$\text{Ca(OH)}_2 = 74.093 \text{ g/mol}$$

~~$$C_1 V_1 = C_2 V_2$$~~

calculations by weight.

3%
